The results from testing all remaining rats and rabbits, and all humans that have worked at CRC in the period in question have come back negative. While this is obviously good news, we remain cautious.

Additional tests will be done to see if we can determine the cause of the initial positive results since these results were determined in two groups of rats and reconfirmed.

Of more practical importance, the incubation period of this particular virus is 4 weeks. We have exceeded that period and no one has displayed the symptoms associated with this virus.

Have a nice weekend.

Cathy
